Digital signal processing (DSP) is the use of digital processing, such as by computers or more specialized digital signal processors, to perform a wide variety of signal processing operations. The digital signals processed in this manner are a sequence of numbers that represent samples of a continuous variable in a domain such as time, space, or frequency.

In signal processing, a digital signal is an abstraction that is discrete in time and amplitude, meaning it only exists at certain time instants. Main article: Digital signal (signal processing) In digital signal processing, a digital signal is a representation of a physical signal that is a sampled and quantized.

Digital signal - Wikipedia

Digital Signal Processors (DSP) take real-world signals like voice, audio, video, temperature, pressure, or position that have been digitized and then mathematically manipulate them. A DSP is designed for performing mathematical functions like "add", "subtract", "multiply" and "divide" very quickly.

In digital processing and waveform analysis Dither is utilized in many different fields where digital processing and analysis are used. These uses include systems using digital signal processing , such as digital audio , digital video , digital photography , seismology , radar and weather forecasting systems.

Dither - Wikipedia

In signal processing, a digital filter is a system that performs mathematical operations on a sampled, discrete-time signal to reduce or enhance certain aspects of that signal. This is in contrast to the other major type of electronic filter, the analog filter, which is an electronic circuit operating on continuous-time analog signals.

Digital filter - Wikipedia

Digital Signal Processing is the science of using computers to understand these types of data. This includes a wide variety of goals: filtering, speech recognition, image enhancement, data compression, neural networks, and much more. DSP is one of the most powerful technologies that will shape science and engineering in the twenty-first century.

What is DSP? - Digital Signal Processing

Digital signal processing (DSP) is the study of signals in a digital representation and the processing methods of these signals. DSP and analog signal processing are subfields of signal processing. DSP has at least three major subfields: audio signal processing, digital image processing and speech processing.
