So as far as this book (Organic Chemistry Part I, 2005) goes, it is one of two in the organic chemistry series released by Berkeley Review. The two books are meant to work as a pair and although by itself Book I is good, it works better with its partner Part II book. The company website sells this book brand new and current for \$25 (two books ...

CHEM 1021: Organic Chemistry II Lecture Course Overview.

CHEM 1021 is a three-credit, lecture only, online organic chemistry course. Since this is the second of two semesters in this series, it will be assumed that the student taking this course has a good understanding of the different functional groups in organic chemistry and of the different reactions these functional groups undergo.

The next section of the course is based on acids and bases of organic nature. The general acid-base concepts (Arrhenius, Bronsted - Lowry and Lewis Concept) and their quantitative expression have been explained in the beginning. Later, the course primarily focuses on organic acids and bases, their properties and behaviour.

If you think back to our discussion of prochirality in section 3.11, you should recognize that the  $(H_a)$  and  $(H_b)$  protons in the examples above are diastereotopic pairs. Most organic molecules have several sets of protons in different chemical environments, and each set will have a different resonance frequency in  $(^1H)$ -NMR spectroscopy.
